

**SECP2613-02 ANALISIS DAN REKABENTUK SISTEM (WBL)
(SYSTEM ANALYSIS AND DESIGN (WBL))**

ASSIGNMENT 2

NAME	MATRIC ID
AFIF SHAQIR IRFAN BIN ARQAM	A23CS0204
MUHAMMAD ADAM BIN RAZALI	A23CS0116
MUHAMMAD AFIQ DANISH BIN MOHD HAZNI	A23CS0118

LECTURER'S NAME: DR ARYATI BAKRI

DATE OF SUBMISSION: 15 APRIL 2024

Question 1(10 marks)

1a) Based on the concept of project management I have learned, there are several feasibility that we need to check on including operational feasibility, economic feasibility, and technological feasibility.

1b) Based on the talk of Abu's to his manager, and the user, it seems that the operational feasibility of the proposed project is low. It is due to the fact that the users were satisfied with the performance of the current system, furthermore, creating a new system was mentioned to disrupt existing operational that could lead to dangerous risk on the company. Moreover, tons of users dislike changes as they need to go through the hassle to learn something completely new unless there is a need for the changes.

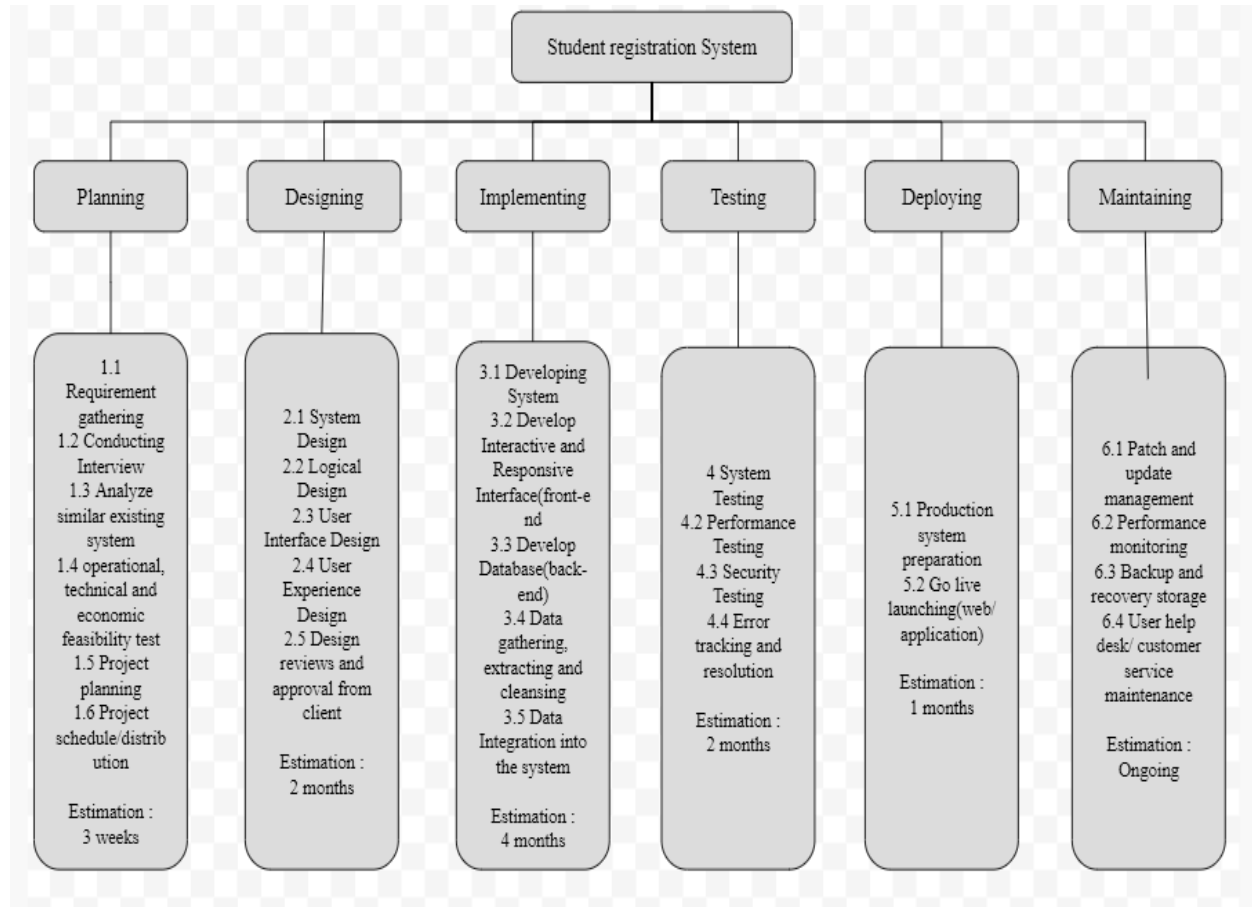

1c)For the economic feasibility, Abu further said that the system change will cost a ton of money draining from the company which should be highly considered as well. In this case, it might be that the benefit of the system change itself could be not as impactful compared to the amount of money they lost

1d)According to Abu's conversation with the system's people, the technological feasibility of updating the system is present, as the required technology is available. However, the availability of technology alone does not necessarily justify the implementation of a new system if the current system is functioning properly without any failure. But, Abu need to keep in mind that the system itself will be incompatible to the software and hardware of the current era that will lead to massive disaster to the company.

1e)Based on the discussions between Ahmad and Abu, I would not recommend doing a total change to the system right away since the primary reason for the system change seems to be updating the company's image and perception, rather than fixing significant operational problems or inefficiencies. Given the potential costs, disruptions, and resistance to change from users, it is better that they maintain its current system, instead I think they should do a phase by phase changes on their system that do not need to people to adapt with a sudden fast changing ui/ux while also saving up some money to do other marketing strategy to boost company's images such as media social content and all that to begin with.

Question 2(10 marks)

work based scheduling is a breakdown of tasks from a bigger one to smaller one to made it easier to monetize and complete.

Question 3 (10 Marks)

Many of today's projects involve team members scattered across different time zones and in different physical locations. Moreover, the projects may have adopted an agile methodology, which reduces cycle time dramatically. Write a brief report that summarizes some of the key differences a manager would face managing this type of project, as opposed to a traditional project.

Title:

Managing an Agile project is different from managing a traditional project

Introduction:

There are two popular methods for managing projects that is traditional and agile. Traditional methods, like the waterfall method keep to a sequential and linear process, but agile techniques like Scrum prioritize modification, flexibility, and progressive development.

Key difference:

-Flexibility

The traditional method provides clear instructions and steps to achieve the goal and objective of the project but the manager would need to approve any changes made while the Agile project allows for priorities to shift throughout the project (changes can be made to anything)

-Progress monitoring

Traditional project management could involve the project manager connecting with other stakeholders while conducting weekly team meetings. An Agile team meets almost daily for a short meeting to identify problems, and all stakeholders are usually informed of the status of the project.

-Documentation

Traditional project management requires complete documentation at every stage, but Agile project management focuses functional systems and processes as well as consistent customer comments. During every stage, the project manager and each team member document their analysis, decisions, and results.

-Testing and approval

In the traditional technique, testing is done by committed teams close to the project's ending, whether it is software or something new. Each stage of agile requires users and customers to test often.

Conclusion:

To summarise, monitoring an Agile project involves flexibility, strong stakeholder cooperation, and a concentration on providing progressive value. Traditional project management following a fixed schedule, being predictable, and having full documentation. The goals and objectives of the project will determine which of these two techniques is better.

Question 4 (10 Marks)

(a) Calculate the cost-benefit estimation using the Present Value (PV) analysis (for 3 years) to assess the economic feasibility for the SkorBestari project proposal in the worksheet. (9 marks)

Costs	YEAR 0	YEAR 1	YEAR 2	YEAR 3
Development Costs				
Hardware	RM 50,000			
Software	RM 15,000			
Training	RM 30,000			
Consulting	RM 80,000			
Data Conversion	RM 40,000			
TOTAL	RM 215,000			

Costs	YEAR 0	YEAR 1	YEAR 2	YEAR 3
Production Costs				
Supplies		RM 15,000	RM 15,000	RM 15,000
IS Salaries		RM 75,000	RM 82,500	RM 90,750
Upgrades		RM 10,000	RM 10,000	RM 10,000
Annual Prod.Costs		RM 100,000	RM 107,500	RM 115,750
Present Value		RM 74,074.07	RM 58,984.91	RM 47,045.67
Accumulated Costs		RM 289,074.07	RM 348,058.97	RM 395,104.64

	YEAR 0	YEAR 1	YEAR 2	YEAR 3
Benefits, Gain/Loss and Profitability Index				
Improve customer service		RM150,000	RM180,000	RM216,000
Increase productivity		RM 150,000	RM 187,500	RM 234,375
Annual benefits		RM 300,000	RM 367,500	RM 450,375
(Present Value)		RM 222,222	RM 201,646	RM 183,051

Accumulated Benefits		RM 222,222	RM 423,868	RM 606,919
Gain or Loss		RM 66,852	RM 75,810	RM 211,814
Profitability Index	0.985			

(b) What is the profitability index (PI) value for this PV analysis? What is your recommendation based on the PI value and justify it. (1 marks)

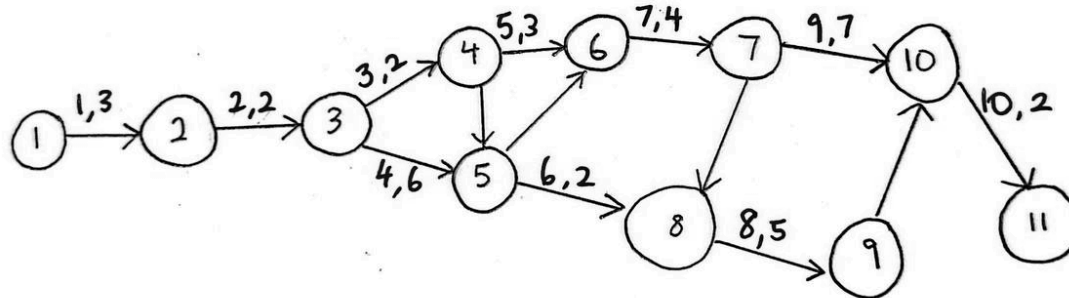

$$PI = \frac{RM\ 211,814}{RM\ 215,000}$$

$$= 0.985$$

Since the PI value is less than 1 (0.985), it is not advisable to proceed with the SkorBestari project. The project may not generate sufficient returns to justify the investment. We suggest to consider exploring alternative investment options.

QUESTION 5 (10 MARKS)

a. Draw a PERT Diagram for the activities.

b. Lists all the paths.

Path 1=1,2,3,4,6,7,10,11=23 weeks

Path 2=1,2,,3,5,8,9,10,11=20 weeks

Path 3=1,2,3,4,5,6,,7,8,9,10,11=21 weeks

Path 4=1,2,3,5,6,7,8,9,10,11=22 weeks

c. Calculate and identify the critical path.

Path 1=1,2,3,4,6,7,10,11=23 weeks

Path 1 has the longest path through the network diagram so it is the critical path.

d. Construct a Gantt chart for the project defined above.
