
Group Project Deliverable 3

Interim Progress: Implementation of Classes

Overview

In this deliverable, you will start implementing your project into code. Here, you are expected to implement these two Object-Oriented Programming concepts: encapsulation and association. Please read this document along with the document about project specification (see the other PDF file).

Requirements

1. Analyze the design of your project (from last deliverable) and determine classes that form association relationship (this should include both the aggregation and composition).
2. Implement the classes and the relationships in C++.
3. Separate the declaration and definition of the classes into files. In this regard, each class should have an header file, .hpp (for the class declaration or class specification) and an implementation file, .cpp (for the class definition).

Deliverable Items

There are THREE (3) items to be submitted for this deliverable:

- Project source code.
- Live Presentation
- Peer and Self Assessment.

Requirements for the Project Source Code

Compressed all the following files in a zip file. The source code should include:

- a. Class header files (*.hpp)
- b. Class implementatin files (*.cpp)
- c. All the main files (e.g, main1.cpp, main2.cpp, etc) that are used for the testing.

Assessments

This deliverable carries **6.5%** weightage for the final grade of this course. The breakdown weightage is as follows:

Criteria	Weightage
1. Implementation of the concept of Encapsulation a. Implementation of the classes b. Each class should include the following members: • Attributes • Constructors and destructor • Accessors and mutators (for all the attributes, and you may add more) • Other helper or convenient methods	1.5 %
2. Implementation of the concept of Association This item will be assessed for both: • Aggregation • Composition	1.0 %
3. Code testing or demo for the classes In items (1) and (2) above, you define the classes. In this item (3), you will test the classes by creating some objects from the classes and perform some manipulations on them. You will do this class by class individually. You do not have to integrate the classes yet.	1.5 %
4. Code organization a. Separate the class declaration and definition. b. Write each class in their own dedicated files: header – for class declaration or specification and the source code, .cpp – for class definition or implementation. <i>Notes:</i> a sample starter project or codebase has been provided	1.0 %

for this deliverable. You may want to refer to it.	
Peer and Self Assessment 1 (PSA1) This PSA is an individual submission. Should you fail to submit, a zero mark will be given automatically.	1.5 %
Total	6.5 %
