The Industrial Talk by PPG had vividly connected my theoretical understanding of ERP and enterprise architecture with real-world practice. Hearing how PPG, a successful global organization with operations utilizes SAP technology to manage its entire business lifecycle from procuring raw materials to delivering the final product was eye-opening. The talk solidified my view that an in-depth understanding of complex integrated systems like SAP is not just academic knowledge, but a fundamental skill set required to drive efficiency and manage complex operations in any large, modern business. This talk has significantly increased my motivation to pursue practical knowledge and skills related to enterprise software.

The talk gave me a better picture of how enterprise systems operate beyond what we usually learn in ESDM class. Hearing how PPG manages its global operations through SAP made me rethink how complex business processes really are, especially when everything from procurement to reporting must stay connected across multiple regions. One thing that I am very amazed is how much the industry relies on people who understand both the technical and functional of SAP and it makes me want to be a SAP Professional. It made me realize that ERP is not just a software skill but a career path that requires continuous learning, collaboration, and the ability to handle large scale digital environment. PPG also mentioned how SAP roles now is rapidly evolve and involve AI, IoT and cloud which makes me think that adaptability in new tools and tech is very crucial in becoming a SAP Professional.

Module 1

Summary from the Talk

An Industrial Talk was delivered by Mr. Patrick Thong (SAP CoE Operation Stream Lead, APAC) and Ms. Sui Chin at the Hyflex Classroom, N28A, Faculty of Computing, UTM. The session provided a comprehensive overview of PPG's global business operations and the critical role of Enterprise Resource Planning (ERP) systems, specifically using SAP technology, to manage their complex processes. The speakers successfully demonstrated the practical application of enterprise architecture, detailing how PPG handles everything from procurement to final product delivery.

Module 2

Technologies & Issues Discussed

PPG described how SAP is implemented through three major workstreams that keep their global system running which is functional, technical and reporting stream; each have their own importance to the company and industry. They also outlined four end-to-end operational cycles supported by SAP which is: Demand to Replenish (D2R) for inventory and supply planning, Order to Cash (O2C) for handling customer orders and payments, Procure to Pay (P2P) for supplier and purchasing activities, and Record to Report (R2R) for financial closing and compliance.

Although the speakers did not highlight technical problems, they discussed bigger issues shaping SAP careers today, including the global dependence on SAP and the rising demand for professionals who can support large scale digital operations. They explained that SAP skills remain valuable because many big organizations rely on integrated processes, creating strong job security for both technical and functional paths. The talk also mentioned about the need for skills with new tech like cloud-based SAP, AI, and IoT as companies shift toward data driven operations.
